DISSECTING GIT'S GUTS: Command Cheatsheets

git init	initialize a git repository	
cd .git	go into the hidden .git directory of a git repo	
git hash-object -w [filename]:	save given file to git database	
git cat-file -p [SHA hash]	inspect git file. "p" stands for pretty, as in human readable	
git cat-file -t [SHA hash]	inspect git file type. the "t" here stands for type	
git update-indexadd [path to file] add a file to the index, aka the staging area	
git ls-filesstaging	examine all files in your staging area	
git write-tree	write a tree object using what's in the index file aka staging	
echo 'your commit message here' git commit-tree [tree hash] write a commit msg, create a commit out of a tree object		
echo 'your commit message here' git commit-tree [tree hash] -p [previous commit hash] write a commit msg, create a commit with it out of a tree object, and link it to a previous commit object. the -p stands for "parent"		

git log --stat [SHA HASH] run a git log on a commit object
